4.0 Technical Characteristic Test

4.1 26dB Bandwidth and 99 % Bandwidth

Test Procedures (ANSI C63.10-2013 6.9.2)

Measure the maximum width of the emission that is constrained by the frequencies associated with the two outermost amplitude points (upper and lower frequencies) that are attenuated by 26 dB relative to the maximum level measured in the fundamental emission.

Test Procedures (ANSI C63.10-2013 6.9.3)

The occupied bandwidth is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers are each equal to 0.5% of the total mean power of the given emission.

Use the 99% power bandwidth function of the instrument and report the measured bandwidth.

Test Settings:

Center frequency = the highest, middle and the lowest channels

- a) RBW = approximately 1 % of the emission bandwidth
- b) VBW ≥ RBW

c) Detector = peak

- d) Trace mode = Max hold
- e) Measure the maximum width of the emission that is 26 dB down from the maximum of the emission. Compare this with the RBW setting of the analyzer. Readjust RBW and repeat measurement as needed until the RBW/EBW ratio is approximately 1%.

Test Procedures

Maximum Conducted Output Power(KDB 789033, Method SA-1)

The transmitter output is connected to a spectrum analyzer and the analyzer's internal channel power integration function is used to integrate the power over a bandwidth greater than or equal to the 99% bandwidth.

<u>Test Settings</u>:

Center frequency = the highest, middle and the lowest channels

a) RBW = 1 MHz

b) VBW \geq 3 x RBW

c) Sweep time = auto

d) Detector = power averaging (rms)

e) Trace mode = Average at least 100

Limit

For client devices in the 5.15-5.25 GHz band, the maximum e.i.r.p shall not exceed 200 mW.

For the band 5.725-5.85 GHz, the maximum conducted output power over the frequency band of operation shall not exceed 1 W.

4.4 Power Spectral Density

Test Procedures

Maximum Power Spectral Density (KDB 789033, Method SA-1)

The peak power density is measured with a spectrum analyzer connected to the antenna terminal while the EUT is operating in transmission mode at the appropriate frequencies.

<u>Test Settings</u>:

Center frequency = the highest, middle and the lowest channels

a) RBW = 1 MHz, 500 KHz (UNII 3)

b) VBW = 3 MHz, 1.5 MHz (UNII 3)

c) Sweep time = auto

d) Detector = power averaging (rms)

e) Trace mode = Average at least 100

Limit

UNII 1 band : the e.i.r.p spectral density shall not exceed 10 dBm in any 1 megahertz band. UNII 3 band : the maximum power spectral density shall not exceed 30 dBm in any 500-kHz band.

4.5 Frequency Stability

Test Procedures

Limit

Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user manual.

Frequency Error (kHz)							
Frequency [MHz]	Temperature						
	o °C	10 °C	20 °C	30 °C	40 ℃		
5 180	-8.024	-19.847	-19.781	-12.598	-6.614		
5 200	-8.758	-20.053	-18.356	-12.910	-7.111		
5 240	-9.291	-20.110	-18.287	-13.188	-7.269		
5 745	-11.803	-21.649	-20.409	-16.118	-10.988		
5 785	-11.932	-21.650	-20.677	-16.390	-11.183		
5 825	-12.059	-21.735	-20.881	-16.655	-11.168		

Note:

Based on the results of the frequency stability test shown above the frequency deviation results measured are very small. As such it is determined that the channels at the band edge would remain in-band when the maximum measured frequency deviation noted during the frequency stability tests is applied. Therefore the device is determined to remain operating in band over the temperature range as tested.
